

Analysis of A/B Test Results

Data Scientist: José Luis Lázaró Contreras

Agenda

Findings of A/B test analysis

- Experiment Setup
- Conversion Rates
- Experiment Results

How Was the Experiment Implemented?

Total Variant Visitors: 35,211

Total Control Participants: 34,678

Conversion Rates

	U.S.	U.K.	CA
Control	10.7%	10.2%	9.4%
Treatment	15.8%	14.9%	15.4%

Executive Summary: The treatment group shows higher conversion rates than the control group across all countries. Conversion rates vary slightly by country, with the U.S. showing the highest overall conversion rate. However, the main observed pattern is that treatment is associated with higher conversion rates in each country.

Experiment Results

- Treatment Conversion Rate: 15.53% (0.15532078043793132)
- Control Conversion Rate: 10.53% (0.1052540515600669)
- Delta in Treatment vs. Control Conversion Rate: 5.01 percentage points (0.050066728877864425)
- p-value: 0.000
- Conclusion:
 - The treatment group had a higher observed conversion rate than the control group. The simulated p-value is approximately 0.000, which is below the Type I error rate of 0.05. Therefore, we reject the null hypothesis and conclude that there is statistically significant evidence that the treatment page improves conversion compared with the control page.
